

# *Examples on cooperation practices and tools in industrial wastewater management in Germany*

**Prof. Dr.-Ing. Peter Hartwig**

## Content

- **Introduction**
- **Approved Technologies – short overview**
- **Structure of Industrial Waste Water Treatment**
- **Cooperation practices**
- **Tools**
- **Evaluation of the costs for the treatment**

## Introduction:

### Goal of the industrial waste water treatment

- **Protection of the receiving waters**  
(surface water, groundwater)
- **Treatment before discharge**
- **Recycling of the waste water flow**
- **Recycling of valuables from the wastewater**  
e.g. raw material, nutrients, metals
- **Usage of the energy contented in the water**  
e.g. using residues from the treatment or the complete  
waste water

## **Main waste water components to be considered**

- **Particles**  
e.g. sand, stones, screws, bones, feathers
- **Organic compounds**  
biodegradable, non-biodegradable,  
measured in the sum as COD or BOD<sub>5</sub>  
Legionella or other hazardous bacterias
- **Nutrients**  
nitrogen, phosphorous
- **Hazardous components**  
cyanide, arsen, phenol, chrome, mercury,  
organic compounds like aromatic hydrocarbons etc.  
- many thousands of parameters -

## **Technologies to be considered**

- **Particles removal**  
sieves, sedimentation, filtration, membrane
- **Equalization of the flow**  
storage tanks (mixing, equalization, pre-degradation)
- **Organic compounds degradation**  
aerobic or anaerobic biological systems,  
suspended biomass/ biofilm systems/ pellets
- **Nutrients removal**  
with biological treatment or with precipitation
- **Hazardous components separation/ elimination**  
biological treatment, oxydation  $H_2O_2$ / Ozone etc.,  
membrane treatment for separation

# Approved Technologies

## **mechanical- physical**

screen, sieve  
filtration  
sedimentation  
flotation  
centrifugation  
adsorption  
evaporation  
equalization  
mixing

## **physical- chemical**

neutralisation  
precipitation  
emulsion cracking  
flotation with  
flocculants  
incineration  
wet oxidation

## **physical- biological**

Mixing and  
equalization  
with biological  
partial de-  
gradation

## **biological**

aerobic  
anaerobic  
  
suspended  
biomass  
  
fixed film

**and combinations of the technologies**

# Rotating Drum Sieve

openings with 0,5 to 5,0 mm

**Screen in chicken factory**

## Sedimentation tank (United Sugar Stach factory, India)

## Compact sedimentation with three Lamella Separators

Lamella  
separator

Biological  
stage

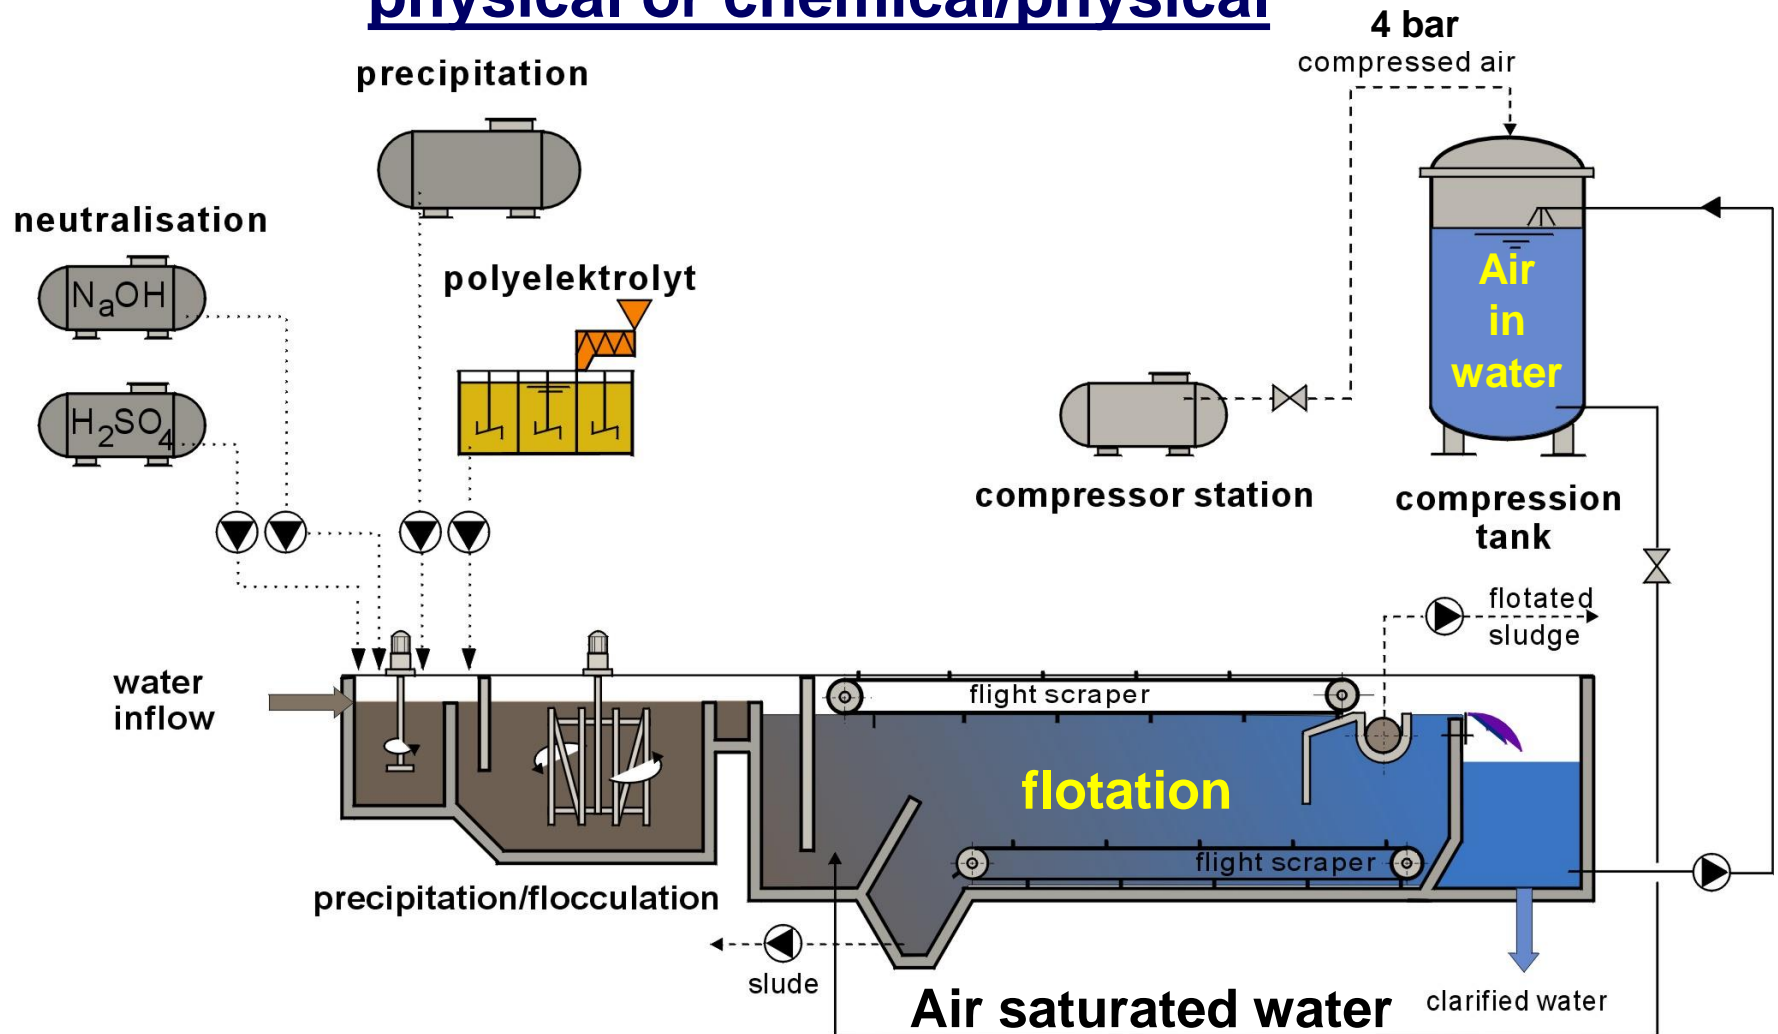

## Lamella separator

used for sludge  
sedimentation in a  
biological stage of  
fish farming waste  
water treatment plant  
(instead of a final  
clarifier)

Caviar production  
Jessen/ Germany

# To remove floating particles – Flotation physical or chemical/physical

**Flotation for the pre-treatment of meat processing wastewater**

**Mixing and equalization tank**  
- with BOD<sub>5</sub>-removal ( $\pm 35\%$ )  
- to be adjusted according to  
the need of the municipal WWTP  
- Operated by hansewasser  
Brewery Beck's, Bremen -

# Mixing and equalization with biological activity

(BOD<sub>5</sub> efficiency 25 – 65 %)

## Activated Sludge Plant - Plant can be shifted to an other location

Industrial waste water treatment for fruit juice processing

## Biofilm technology

Treatment of paper  
waste water with  
aerobic fixed film

**aqua consult**  
Ingenieur GmbH  
Hannover/ Germany

**Membrane Test Plant for choosing effective membranes**

**Anaerobic high loaded reactor  
- fruit juice production -**

## Anaerobic Dairy wastewater treatment

**Anaerobic Treatment of brewery wastewater (UASB), inner-city**

## New developments

- Anaerobic treatment followed by full stream deammonification – solving the N-problem  
(Example: Yeast factory waste water)
- Deammonification:  $\text{NH}_4\text{-N} \rightarrow \text{N}_2$
- Organic content can be used for biogas production
- No problem with denitrification

Yeast factory Schwarzenbach/ Germany

## New developments

- **Using aerobic granulars to reduce the footprint for biological treatment**
- **Perfect settling behavior**
- **Higher concentrations support the granular building**

## New developments

- **Production of Bioplastics from sewage**  
(Reserach projects under execution)

## Examples of industrial plants near the Baltic sea

# **Structure of Industrial Waste Water Treatment and relevant tools**

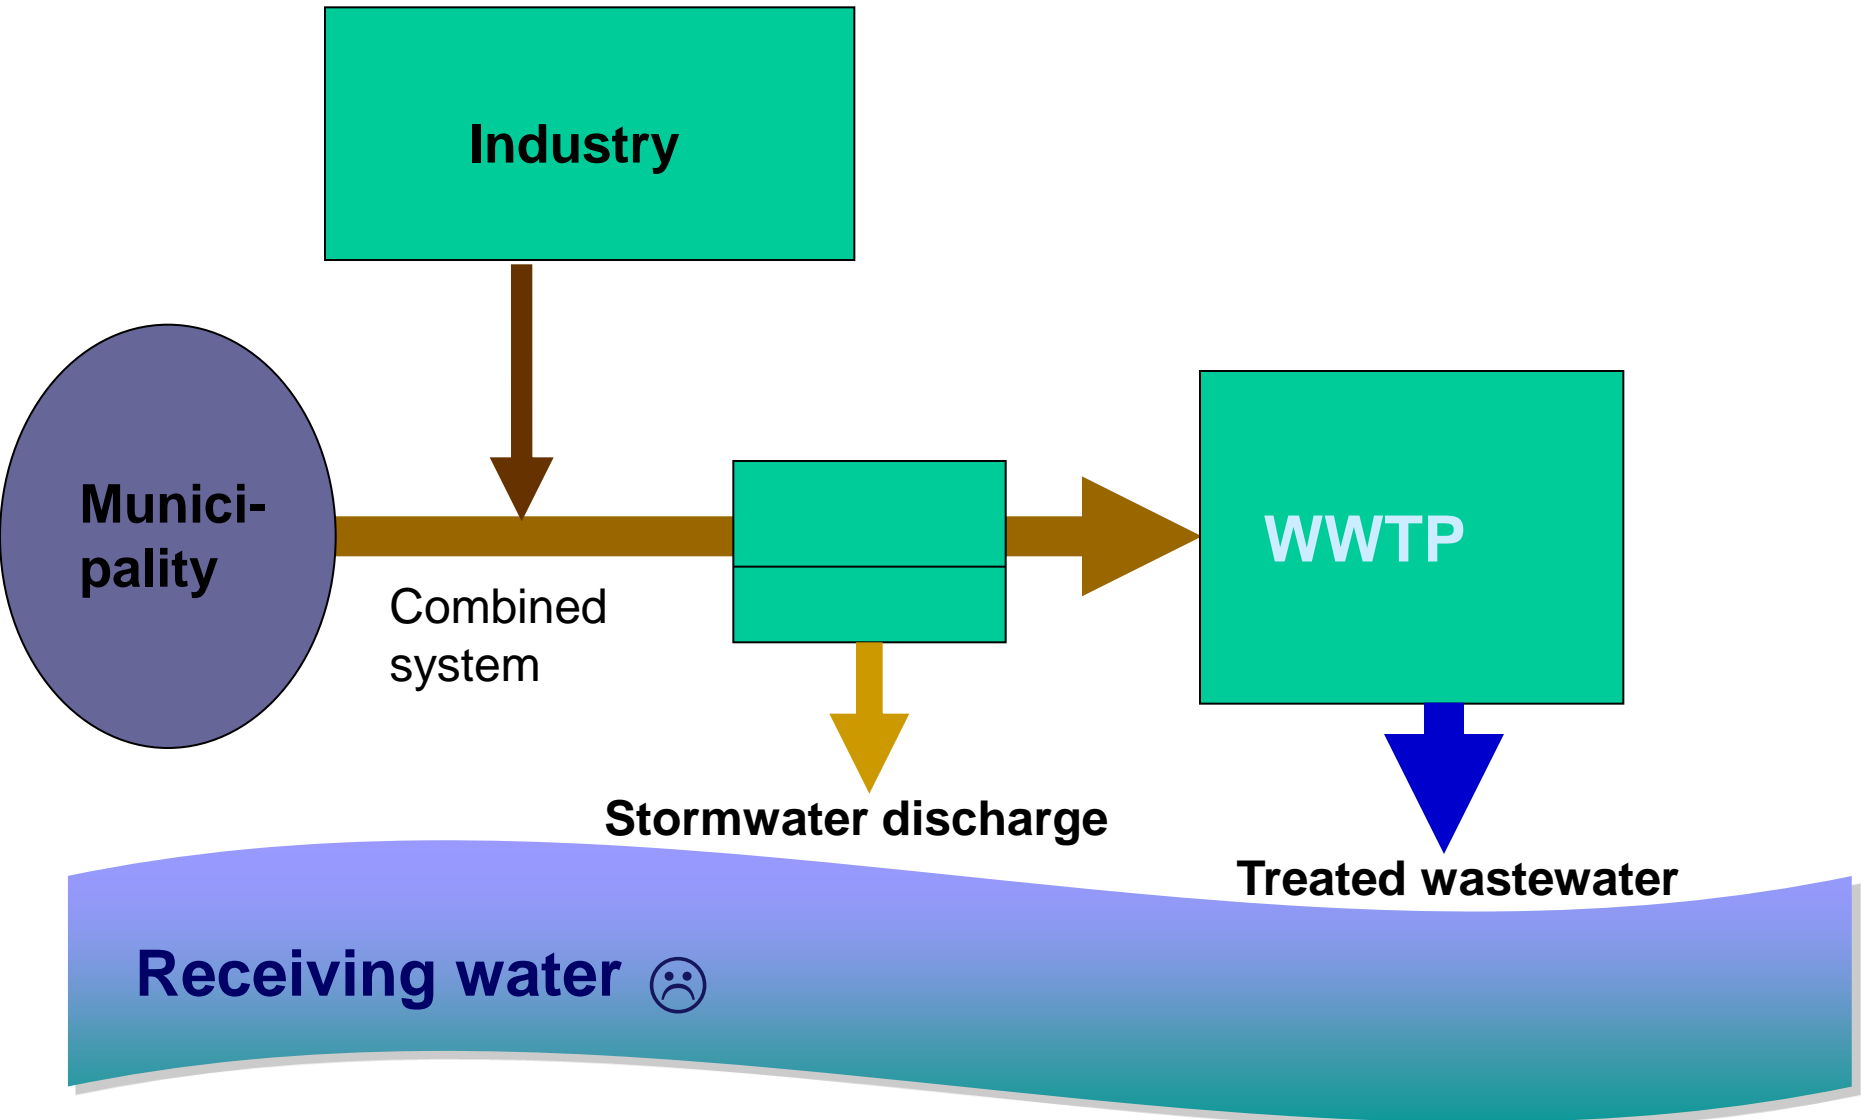

- **Indirect discharge**
- **Direct discharge**
- **Internal Reuse**

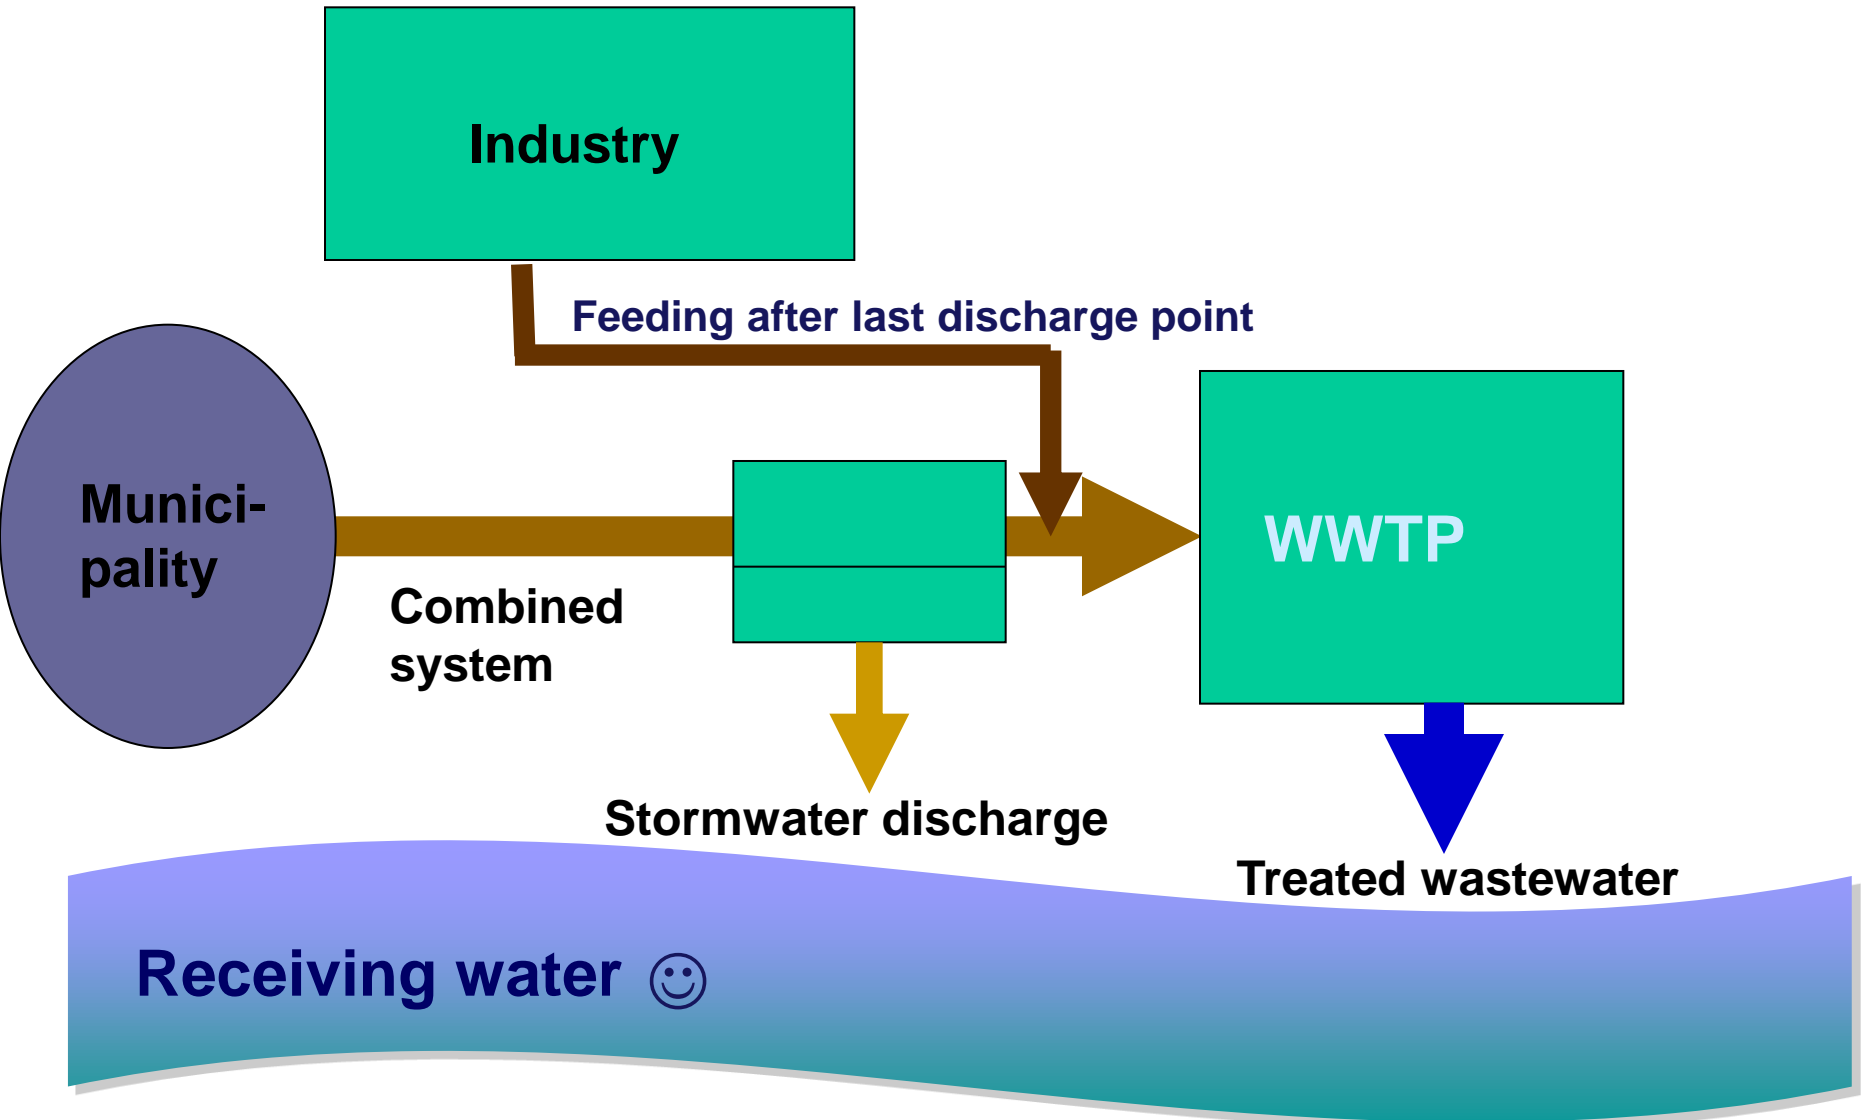

## **Structure of industrial waste water treatment**

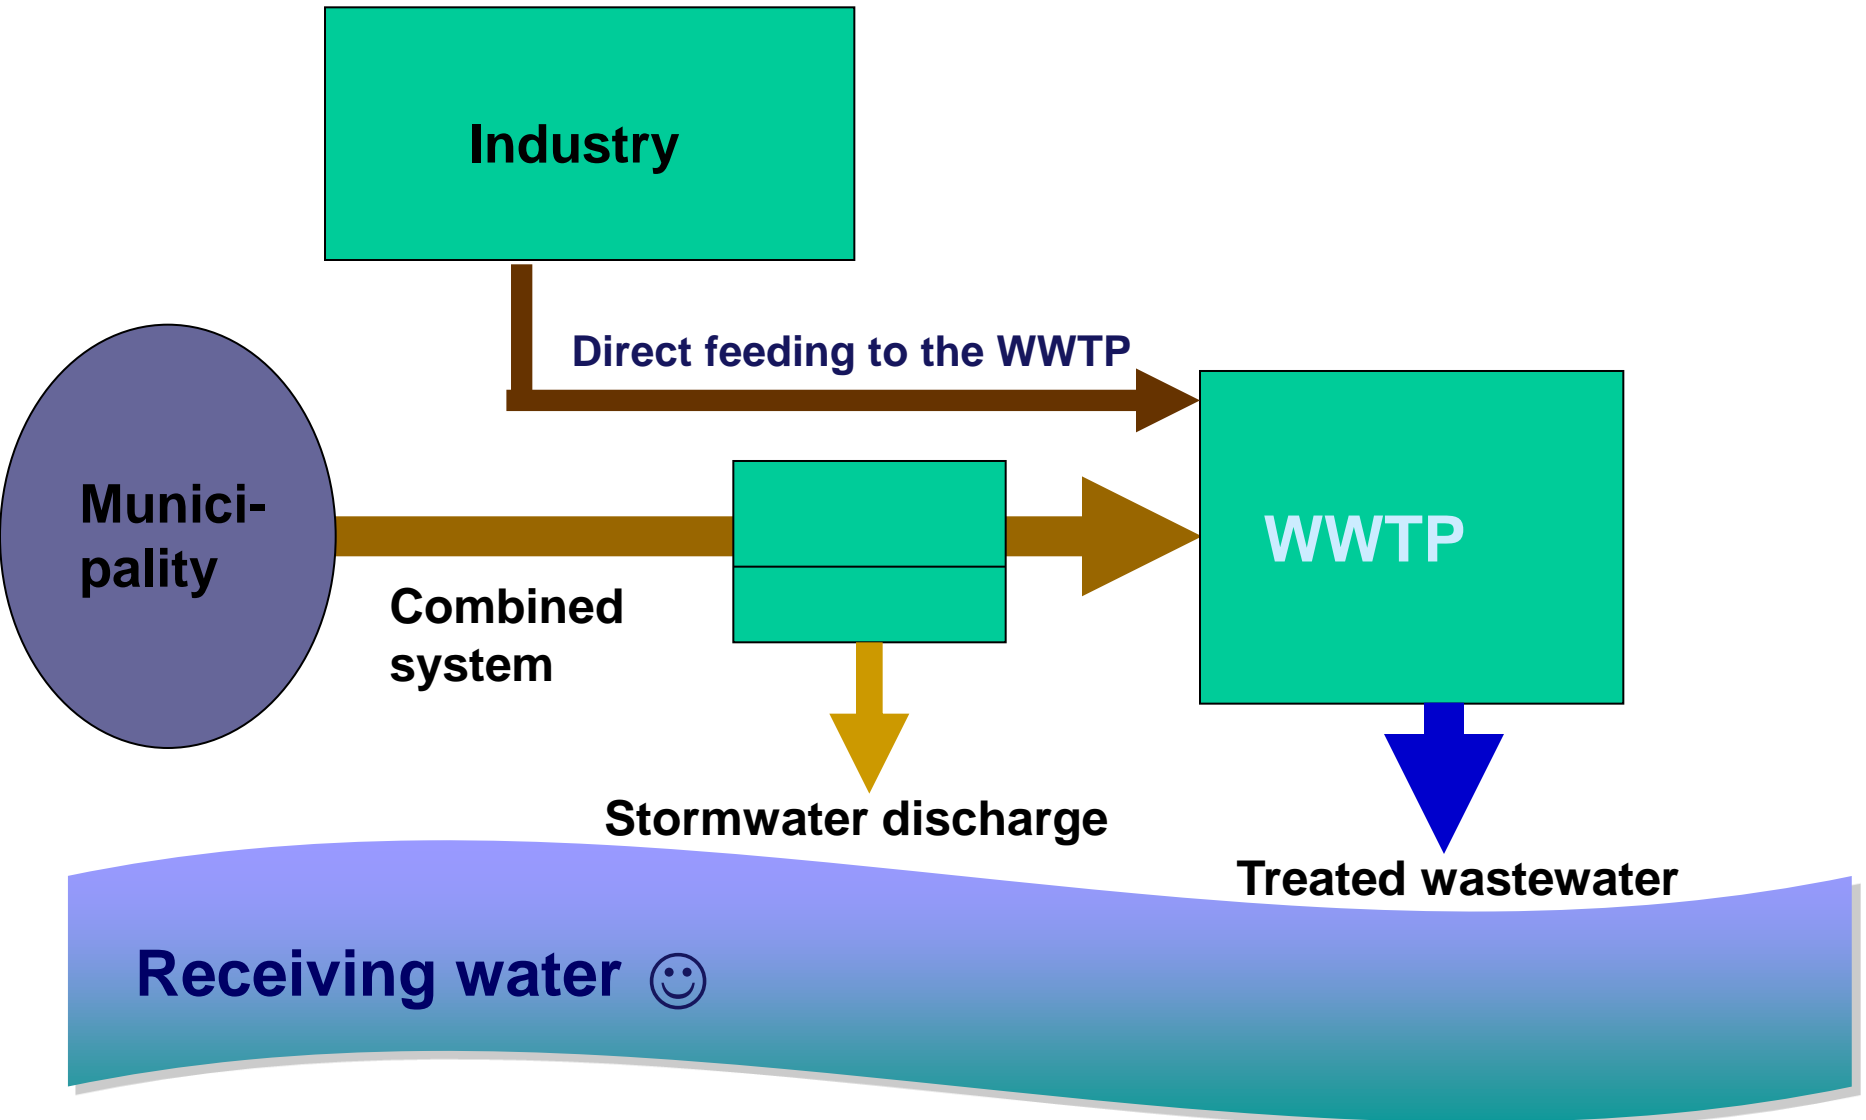

- **Indirect discharge**

- The industrial wastewater will be discharged to the public sewer **(if required after a pre-treatment)**
- Mixing with the municipal, commercial and other industrial wastewater streams
- The treatment costs for the industrial waste water in the sewerage network and in the treatment plant have to be considered
- The characteristic of the sewerage system has to be considered

## Control of the industries in the catchment area

- Cadaster of indirect dischargers  
with basic information and all measurements
- Waste water sampling and analysing  
standard sampling/ additional sampling  
- cost distribution to be agreed
- Sewer biofilm control  
in case of toxic parameters  
or sludge pollution problems
- BREF ( **B**est available techniques **Re**ference Document)  
detailed information about production processes and  
benchmarks for maximum allowed specific pollution

## Structure of industrial waste water treatment

- **Direct discharge – Separate treatment**
  - The industrial production wastewater will be discharged directly into a receiving water body
  - Significant dependency from the type of production (changes in production, seasonal impacts)
  - Evtl. unilateral composed wastewater (evtl. dosage of nutrients required)
  - The sensitivity of the receiving water may have significant impact to the requirements

## Example for direct discharge:

### Woold Pulp Factory Estonian Cell

**Anaerobic Treatment**

**Aerobic Treatment**

## Structure of industrial waste water treatment

- **Internal Reuse – up to ZLD (Zero Liquid Discharge)**
  - No connection to the sewerage system
  - No discharge possibility
  - The waste water from the production will be reused in different qualities in the factory
  - Significant dependency between production and the wastewater treatment  
(Start-up phase, problems in the production)
  - Only seldom realized because of high costs
  - Requirement in textile industries in India and Bangladesh **(imo this makes no sense)**

**Industrial Wastewater treatment  
- closed water cycle in the fibre  
board production in Switzerland**

## Structure of Industrial Waste Water Treatment

- **Collection of specific waste water in separate networks or in one area**
- **Specific treatment technology can be applied to that specific waste water**

**Olive processing waste water network in Pillas/ Spain**

**8 Tanneries are resettled from Damascus center into the Industrial Park Adra in Syria**

## Structure of Industrial Waste Water Treatment

- Collection of several industries in Industrial parks
- Pre-treatment requirements have to be adjusted (e.g. not to collect only unbiodegradable wastewater)
- Treatment of organic residues to be considered

**Industrial Park  
HOECHST Frankfurt,  
served by infraserv**

## Where is a pretreatment plant located?

- At the companies site
- On the municipal waste water treatment plant
- Separate location

**Paper production waste water treated on the area of the municipal waste water treatment plant site**

## Who is operating the treatment facilities?

- Own staff of the company
- Experienced staff from the municipal waste water treatment plant
- Operation through a separate partner

**BECKs pretreatment facilities  
operated by hansewasser Bremen**

## Sludge treatment

- **Waste water treatment = production of sludge**
- **Sludge fractions might be reused (e.g. flotite in paper factories)**
- **Sludge residues from biogas plants – What to do?**  
(in Germany 7,500 biogas plants)
- **Thermal hydrolysis as conditioning before digestion**  
(to improve the performance and to replace chemicals)

Borregrad paper factory,  
Saspsborg/ Norway

## **Co-Fermentation of organic residues with municipal sewage sludge**

- **Solution for the treatment of organic residues**
- **Equalization of the co-substrate characteristic through the (slowly) sewage sludge**
- **Higher efficiency of municipal digesters (up to 2,5 m<sup>3</sup> biogas per m<sup>3</sup> reactor volume instead of only 0,5 for municipal digesters)**
- **Energy autarkic operation of a municipal waste water treatment plant is possible**

## Evaluation of the costs of the treatment

- Invest and running costs
- Not to forget the sludge treatment costs
- Costs for combined treatment/ indirect discharge
  - evaluation according to usage of the facilities
  - relevant Parameter **Q, COD/ BOD<sub>5</sub>, N, P, SS**
- Industrial waste water might be more or less expensive like municipal waste water

## Result of detailed cost calculation

Complete running costs considering financing and operation for 9 cities in Germany

### Cost Splitting for waste water treatment plants in components

Parameter	Unit	R	I	W	H	W	Z	B	K	B	Average
Capacity	PE	30.000	40.000	60.000	60.000	70.000	25.000	40.000	10.000	45.000	
Q	€ / m <sup>3</sup>	0,40	0,48	0,24	0,19	0,18	0,37	0,42	0,32	0,21	0,31
CSB	€ / kg	0,34	0,33	0,50	0,39	0,29	0,34	0,52	0,46	0,41	0,40
N <sub>ges</sub>	€ / kg	4,65	3,91	3,74	1,32	1,82	3,15	4,18	4,10	2,31	3,24
P <sub>ges</sub>	€ / kg	6,51	6,29	13,16	8,76	8,69	6,72	40,63	10,69	9,33	12,31
SS	€ / kg	0,14	0,05		0,85		0,69		0,61	0,53	0,48

## **Practices**

- **City of Hannover**  
Example for indirect discharger control  
Philisophie and stucture
- **Direct discharge**  
Brewery with direct discharge
- **Industrial Park for Chemical Industry**  
Central treatment for wide range of productions
- **Negative Example: City of Weißenfels**  
No comprehensive regulation leds to high penalties

## **Available tools**

- **Direct discharge**
  - Requirements depending to the minimum requirements and the river management concept
  - Supervision up to online connection through the authorities (for larger water quantities)

## **Available tools**

- **Indirect discharge**
  - **Indirect discharge guidelines**
  - **Indirect discharge cadastre**
  - **Cost distribution calculations**
  - **Biofilm control for toxic or hazardous components**

## Available tools

- Industrial parks
  - Regulation about pre-treatment
  - Cadastre
  - Regulations for the cost calculation for the industrial park users for waset water and organic residues

## **Conclusion**

- **Technologies**  
for the treatment of all industrial waste waters are available, up to Zero Liquid Discharge
- **Most efficient technological solution**  
can be found with experiences from planing, realization and operation
- **Practices**  
Wide range of applications and experiences  
– important to have a comprehensive structure
- **Tools**  
Guidelines, Users Cadastre, Supervision schemes,  
Cost calculation schemes
