

Household and Industrial Wastewater— Legal and Practical Issues

Sources of Information

Surveys commissioned by VARAM (Ministry of Environment Protection and Regional development):

1L/47/2017, Actualization of pollution parameters of Typical household wastewater, Stage II

1L/34/2018, Actualization of Water management data in 49 Agglomerations with 2000 – 10000 PE

20 years experience in the field of municipal and industrial wastewater

1L/47/2017, Actualization of pollution parameters of Typical household wastewater, Stage II

Typical household wastewater – why is it so important to quantify it?

LR MK No. 34

PARAMETER	CONCENTRATION (mg/l)
COD	210-740
BOD5	150-350
Suspended solids	120-450
Ntot	20-80
Ptot	6-23

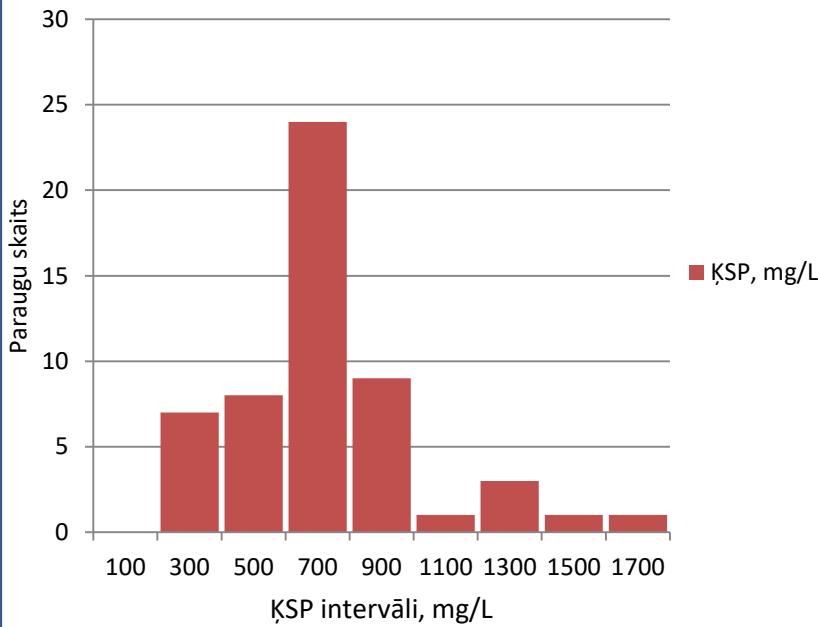

- Values date back to 2002, i.e. have not been updated for 17 years
- Household water consumption has gone down significantly since 2002.
- Ergo, says the industry, pollution values should be higher
- Nay, say municipalities, these values are just fine as they are.

Wastewater sampling times and addresses, 2017

Sample distribution as per LR MK 34:

Conclusions from the household wastewater sampling program

- While average observed BOD_5 was only 352 mg/L (MK 34. max value: 350 mg/L), average observed BOD_5 during the Summer session was 384 mg/L, median value: 410 mg/L, 85% percentile: 482 mg/L. Elevation of max BOD_5 value in typical household wastewater to 400 – 410 mg/L should be considered;
- While average observed N_{tot} value was only 89,7 mg/L (MK 34. max value: 80 mg/L), average N_{kop} during the Summer session was 104 mg/L, median value: 97,5 mg/L, but 85% percentile: 131 mg/L. Elevation of max N_{tot} value in typical household wastewater to 100 mg/L should be considered.

COD Results distribution

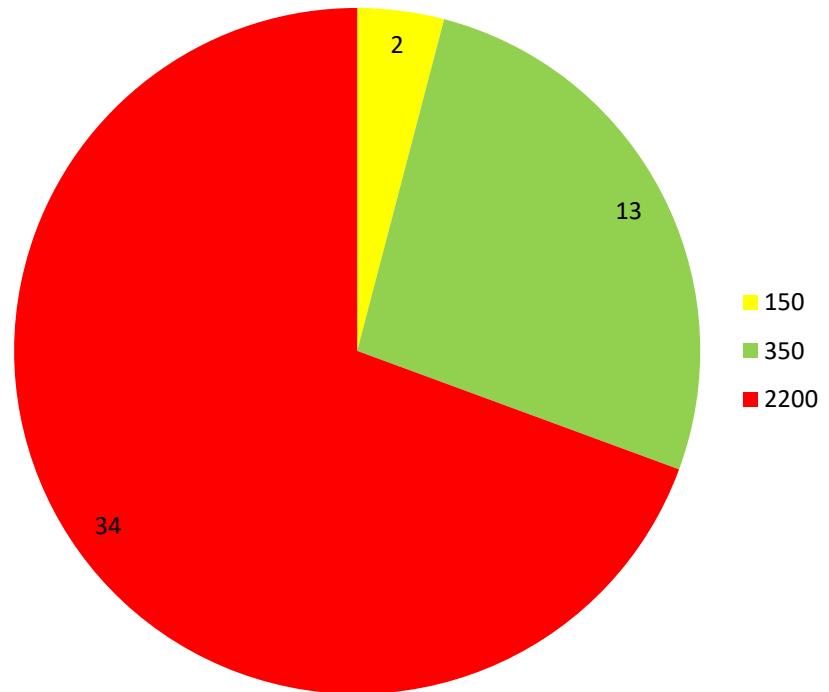

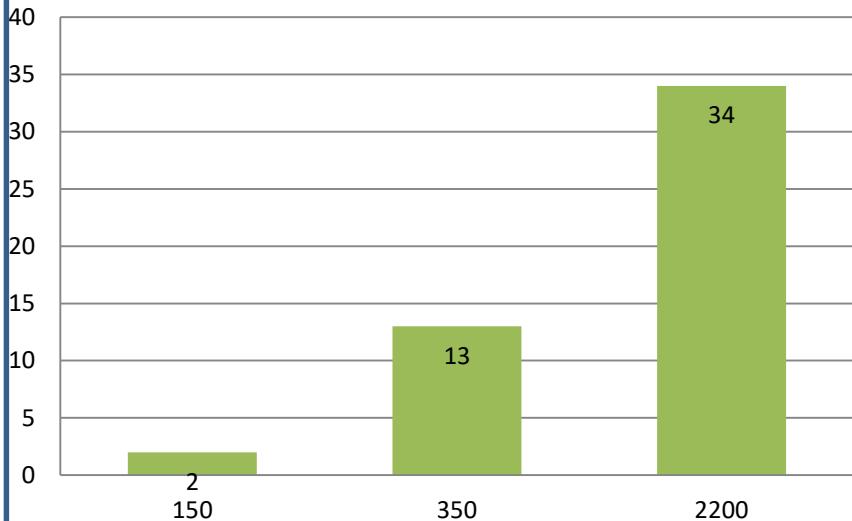

COD Results distribution compared to LR MK 34 values

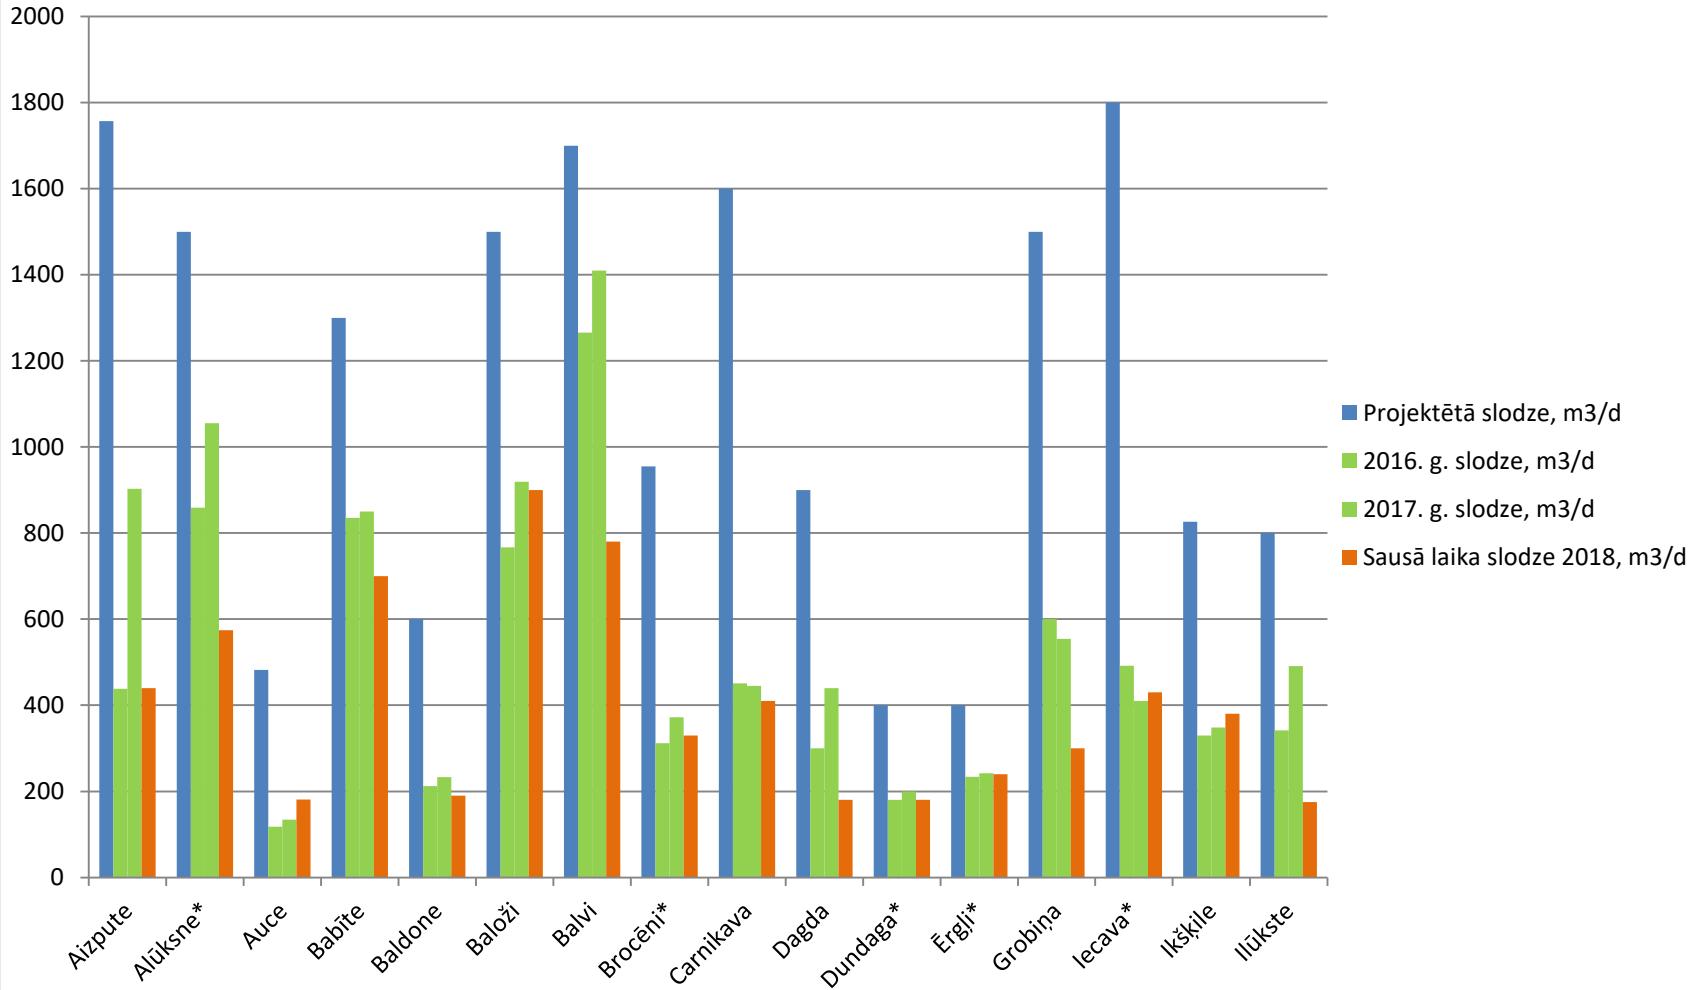

BOD5 results distribution

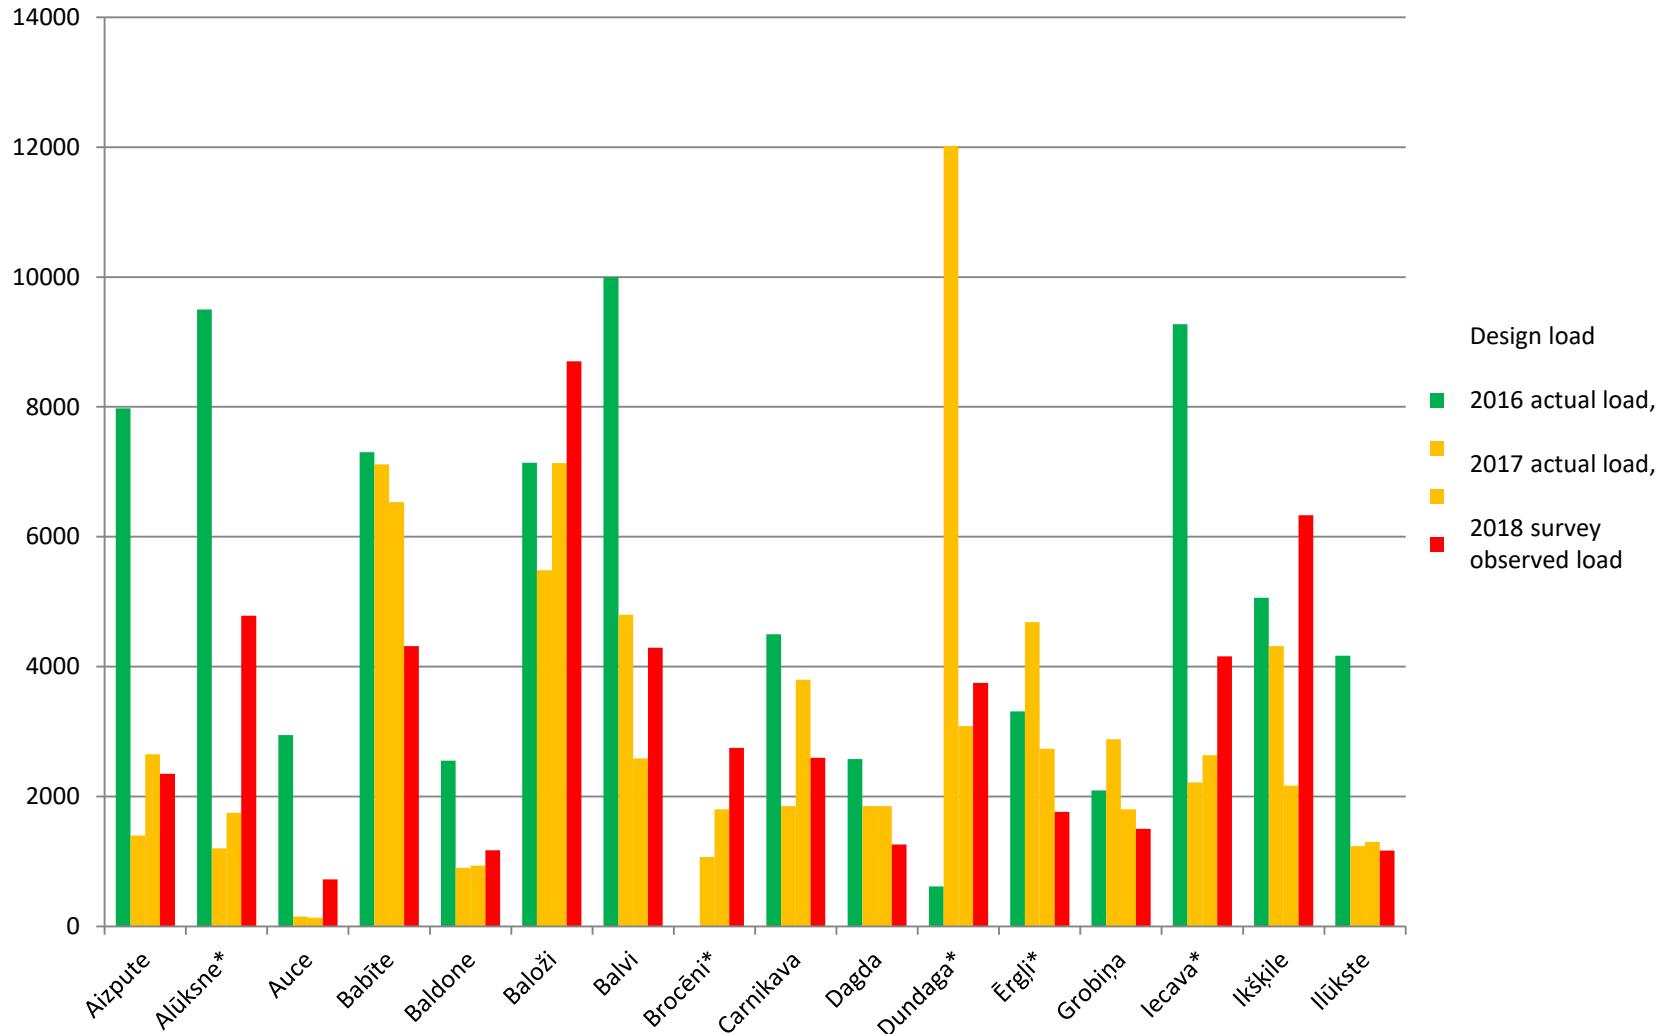

BOD5 Results distribution compared to LR MK 34 values

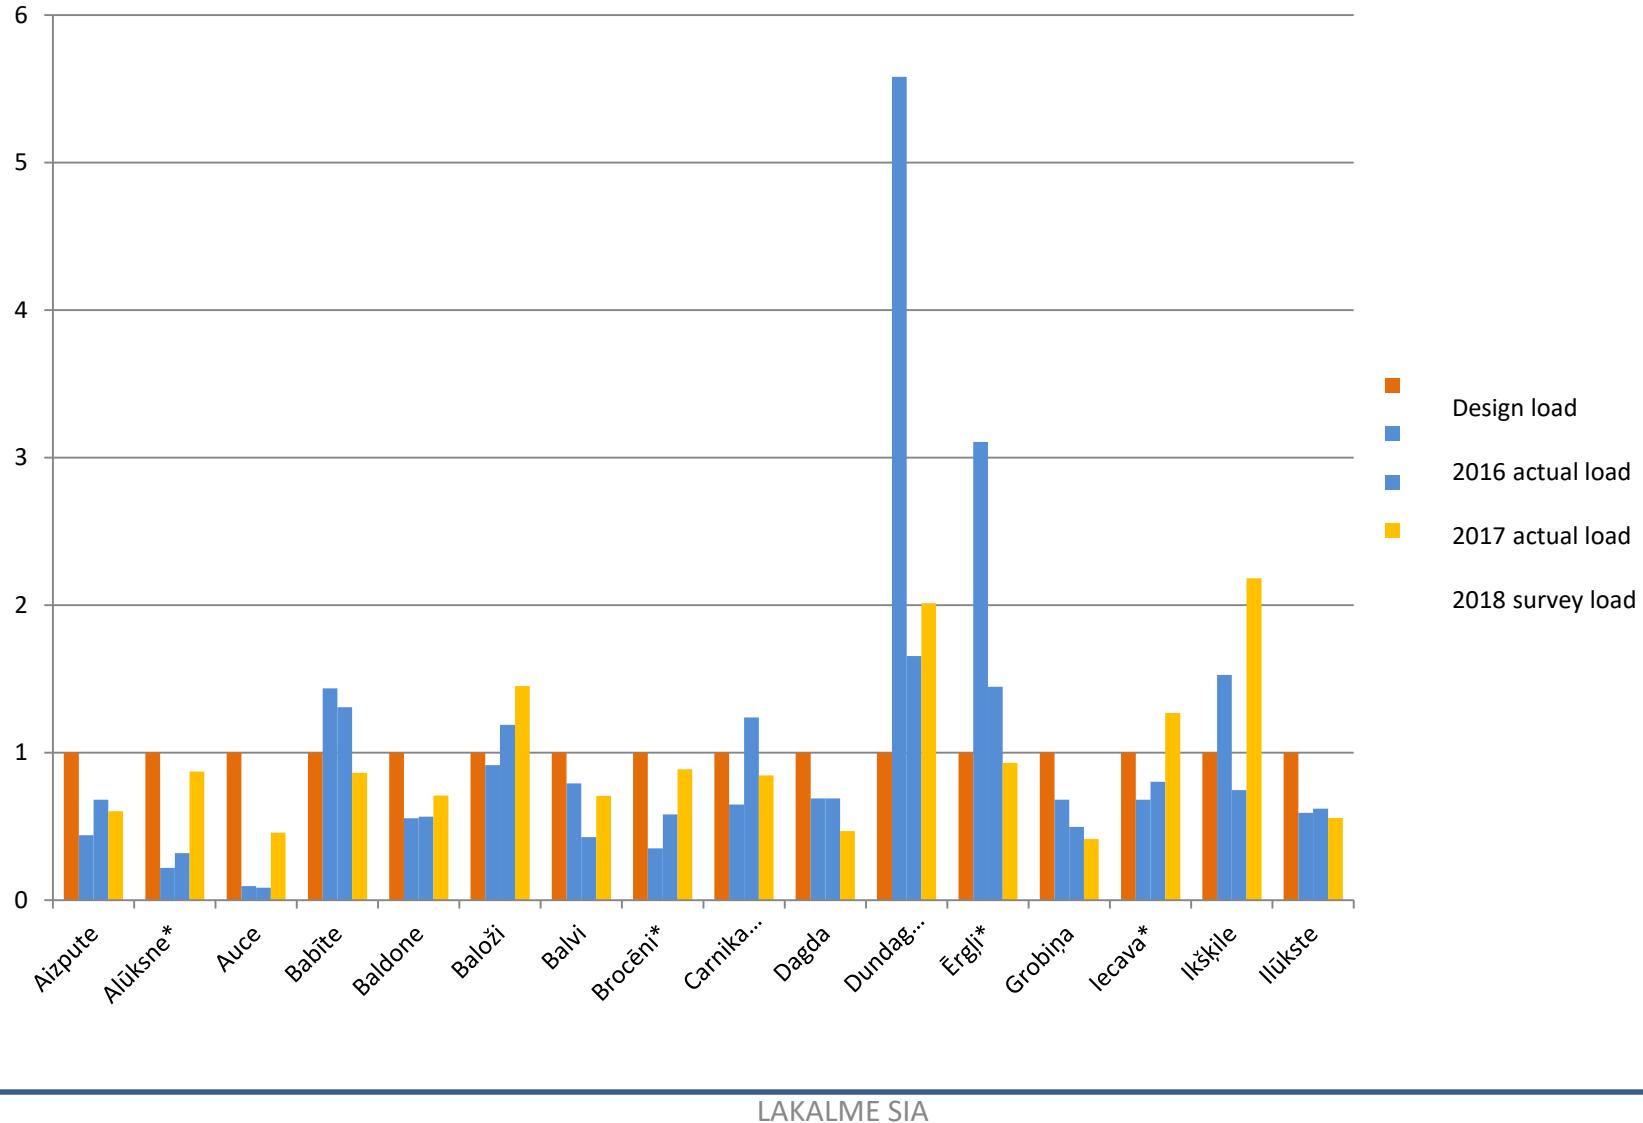

Design and actual hydraulic loads in the surveyed municipalities (Part 1)

Design and actual PE loads on WWTP's (in PE), Part 1

Design and actual BOD5 load, in PE/Number of persons actually connected to the municipal sewerage network

Conclusions from the municipal wastewater sampling program

- The observed COD and BOD₅ values significantly exceed those listed in the Regulations No. 34 from Latvian Republic Cabinet of Ministers from January 22, 2002 (Table parameters characterizing typical household wastewater).
- Since the weather during the sampling period was exceptionally dry (the driest Summer in decades) the observed values can be considered representative dry weather values.

Problems the food industry is facing

Inability to meet the effluent standards required by the municipality

Inability to invest in sustainable technology

This is supposed to be a flotation unit

Flotation system price vs. capacity

- - 5 m³/h, flotation system price app. 67.000,- €
- - 10 m³/h, flotation system price app. 75.000,- €
- - 15 m³/h, flotation system price app. 86.000,- €
- - 20 m³/h, flotation system price app. 95.000,- €
- - 35 m³/h, flotation system price app. 120.000,- €
- - 50 m³/h, flotation system price app. 132.000,- €
- - 80 m³/h, flotation system price app. 160.000,- €

What the legislation says

Regulations No. 174 of the Cabinet of Ministers «Regulations regarding provision and receiving of water supply services» from March 22, 2016:

In case the maximum permissible concentration of BOD5 and COD in wastewater has been exceeded, compensation is to be calculated for the excess COD concentration only. Compensation is to be calculated as follows:

$$V = T \times K \times (R - 1), \text{ where}$$

- V – compensation (€);
- T – Regular tarif (€/m³);
- K – Quantity of the discharged wastewater (m³);
- R – Coefficient which is calculated as follows::

$$R = E/M, \text{ where}$$

- E – Maximum observed concentration of the parameter in wastewater(mg/l);
- M – permissible concentration of the said parameter (mg/l).

CONCLUSIONS

- Best available practices in industrial wastewater treatment and pre-treatment should be defined, together with the expected results these practices shall produce,
- Recommended control procedures and controllable parameters should be defined for monitoring the wastewater pre-treatment plants based on the above best available practices,
- When the said best wastewater pre-treatment practice has been implemented, guidelines shall be provided for the municipalities regarding regular tariff calculations, and emergency situations.
- Financial resources shall be allocated specifically for water intensive, but small scale producers to support sustainable wastewater pre-treatment technologies,
- Control mechanism should be designed to control the utilization of the said resources. The mechanism should include wastewater pre-treatment efficiency monitoring program & penalties for violations.

THANK YOU FOR YOUR ATTENTION!
